Invasive Plant Suitability Overlap Across Africa

Species overlap	Current (km²)	SSP370 (km²)	Change (km²)
No species	27,484,370.27	20,957,064.03	-6,527,306.23
1 species	4,602,346.64	7,885,025.60	3,282,678.96
2 species	1,677,603.99	2,577,108.25	899,504.26
3 species	1,394,362.98	3,654,544.29	2,260,181.32
4 species	30,180.37	115,122.07	84,941.70

These maps illustrate the current and projected climatic suitability overlap of four invasive plant species (Chromolaena odorata, Leucaena leucocephala, Mimosa pigra, and Opuntia stricta) across Africa under SSP370 (2061–2080). In the current and future maps, warmer colors indicate greater species overlap. In the change map, green indicates decreases, while orange and red indicate increases in the number of species with suitable habitat.

Coordinate Reference System (CRS): Africa Albers Equal Area Conic

Data Sources
Species occurrence data: GBIF. Climate data: WorldClim v2.1 and CMIP6 SSP370 projections.
